

Project Title: The Impact of Gaming Habits on Mental Health and Lifestyle

Project Description: In the modern digital age, video games have become an integral part of daily life. This project investigates the "Gaming and Mental Health" dataset to explore the fine line between healthy digital entertainment and gaming addiction. Utilizing data analysis techniques, our team aims to evaluate how varying gaming habits (such as daily playtime, preferred genres, and platforms) directly impact players' psychological well-being, physical health, academic or professional performance, and social interactions.

Key Objectives & Research Questions:

- **Mental Health & Sleep:** What is the correlation between excessive daily gaming hours, sleep disruption frequency, and mood swings?
- **Academic & Work Performance:** Does a high "addiction risk level" negatively affect academic grades (GPA) and work productivity scores?
- **Physical Health:** Which gaming platforms or genres are most associated with physical ailments such as eye strain, back/neck pain, and weight changes?
- **Social Isolation:** To what extent do gaming habits reduce face-to-face social hours and increase feelings of social isolation?

Expected Outcomes:

- A comprehensive analytical report detailing players' behavioral patterns supported by data-driven evidence.
- An interactive dashboard allowing users to explore the impact of gaming on health based on age, genre, and platform.
- A set of recommendations to promote healthier gaming habits and prevent the negative consequences of excessive playtime.
